

Pick-to-Light Order Processing

Deliver Right...Now!™

Optimal order processing – Tight integration . . .

Now you can have all the benefits of Pick-to-Light as a direct extension to your existing ERP Software. Continue tracking inventory and managing replenishment in your ERP, with real-time posting of transactions. The system integrates directly with your existing software, so your customer service representatives see accurate order status, and can update orders until picking begins.

ERP-centric.

You depend on your ERP system to run your business! Any systems you implement should retain real-time visibility of orders throughout the fulfillment process. Using certified interfaces, Triact's Order Processing system retrieves order/line information as picking of an order begins, and each picking transaction is posted to your ERP as it occurs. No data synchronization or batch processing!

Faster.

By lighting the exact location or locations needed, pick-to-light is acknowledged to be the fastest operator-based picking strategy available. In the time it takes to hear and interpret a location number or read a location number from a pick list or an RF terminal screen, the pick-to-light operator is already making the pick.

More accurate.

By getting the operator to the right location each time the picking process is greatly simplified. Task simplification and replication produces accuracy.

Paperless.

No more pick sheets to handle and tally marks to record. Pick-to-light operators simply scan an order number on the carton or tote and the system does the rest. Paperless picking reduces costs, reduces errors and streamlines operations.

Turn on your picking machine ...

Faster order fulfillment is within reach! Don't settle for grinding through standard ERP processes. Call us today and find out how Triact can help you *Deliver Right...Now!™* for your customers.

Simultaneous.

Other computer-based solutions like RF terminals and voice terminals are sequential in nature. The equipment is only capable of showing what the computer thinks should be the next pick. In a pick-to-light system ALL locations required in an area can be lit up at once. This allows the operator to choose the best pick path and even pick in both directions.

Cost effective.

Recent advances in technology and the advent of Windows-based computer systems have brought the cost within reach of nearly all order fulfillment operations.

No hardware hassles.

The Twin Wire design from Lighting Pick Technologies allows modules to operate independently, without

interconnected cabling, for fast and easy installations and system maintenance. Convenient surface mounting onto existing rack or shelving systems reduces installation time and costs.

Easy to manage.

Juggle order priorities and automate release for picking; Set up zones, item locations, box tare weights, and more through a simple administrative interface. Orders remain in your ERP system, but management of order processing is handled in the picking system to optimize picking throughput.
